Mastering Magento for E-Commerce Training provides in-depth knowledge of the concepts such as Magento Architecture, Data models, MVC, Rendering systems, REST Webservices and Admin Html to make the delegates Magento expert. The delegates will understand the basic directory structure which is followed by Magento. The delegates will also learn the various code pools for development and understand how to start with a basic configuration file. With the help of the training, the delegates will learn about the factory classes, how to call them, and how to override them for custom development. The delegates will understand how to implement a new module in Magento to derive Business Insights.

The delegates also get to know about the Magento event handling system. The delegates will able to understand how a request is processed or handled, how a module is initialised and how we can rewrite the URL's. Throughout the training, the delegates will understand the design/theme basics and how the templates are called. The delegates also understand how they can be overridden for various themes. The delegates also get an opportunity to understand how to Magento defines blocks and calls them through the layout XML.

With the help of training, the delegates will able to define their custom database scripts to add, update, alter, and delete the database. The delegates will understand how the Magento handles the attributes. The training provides complete knowledge of Magento admin. The delegates will learn how to create users and also understand how to set their permissions. The delegates will get to know how to create Admin module and how forms and grids work. At the end of the training, the delegates will able to track down Magento errors easily by using the Xdebug for PHP.

Prerequisites

For attending this training, the delegates should have knowledge about simple scripting language, and thus there is no need for any knowledge of Java.
